

## ABSTRACT

The present invention relates to methods and arrangements for rapid dialing in a telecommunication system that requires an indication of a B-number termination to establish a connection. The system is communicating with a telephone set (POTS) without ability to indicate such termination. A B-number is dialed using said telephone set. A B-value composed of the so far dialed digits is compared with a list of records stored in a database in the system. Conformity is found between the composed B-value and a record in said list, which found record points to a numeral representing the total number of digits in the complete B-number.
